eVideon HELLO

Put patients in contact with loved ones.
Health. Engagement. Learning. Loved Ones.

Contact-Free Interaction

Oftentimes, whether due to isolation status or simply being far from home, patients can't have their loved ones come to visit. But the comfort of talking with and seeing friends and loved ones is still so important to ease anxiety and provide an excellent patient experience. With eVideon HELLO, patients can use their own devices or a hospital borrowed device to "visit" with friends and family. Patients can connect one-on-one or in a group video chat.

Your Branding

Patients will be greeted with the warmth and familiarity of your hospital, your logo, your colors, and your imagery. HELLO's user interface will be customized to be unmistakably yours across multiple sites and throughout your organization.

Three ways to say "HELLO"

- Patient → Loved one (to connect with friends & family who can't visit in person)
- Nurse → Patient (from outside the room to save PPE)
- Physician → Patient and family (for multi-way consultation)

Nothing to Download

With HELLO, patients can video chat with loved ones easily and seamlessly. eVideon HELLO does not require any software downloads. Patients can use a hospital-provided tablet or their own devices (by scanning a QR code or following a simple instruction sheet) to quickly connect and start a video chat session.

No Logins

Patients don't have to create accounts or remember login information. HELLO provides instant connection without the hassle of third-party software. Furthermore, HELLO is designed with all end users in mind. The interface is clean and simple, so patients of any age or ability can easily connect with their loved ones.

Fully Cloud-Based and Flexible

eVideon manages your solution completely and in a cloud-based environment - no additional IT resources needed. Because it's web-based, HELLO can run on any device or operating system, so there's no need to invest in specific hardware.
